| <b>Course name: COMPREHENSIVE EXAM (.....)</b>   |   |  |    |                       |                 |
| Max. Marks: 50   |   | Duration: 1 Hour   |    |                       |                 |
| <b>Instructions:</b>   |   | (1) Each question carries one mark. No negative marks for wrong answers<br>(2) Total number of questions: 50<br>(3) All questions are to be answered. Each question will be followed by 4 possible answers of which only ONE is correct.<br>(4) If more than one option is chosen, it will not be considered for valuation.<br>(5) Calculators are not permitted |    |                       |                 |
|  |   |  |    |                       |                 |
| 1.   | Which data structure is used to store the undo history in a web browser?  |  |    |                       |                 |
| <b>Answer: a) Stack</b>  |   |  |    |                       |                 |
|  | a)  | <b>Stack</b>   | b) | Queue                 | c) Linked List  |
|  | d)  | Hash table   |    |                       |                 |
| 2.   | When a pop() operation is called on an empty queue, what is the condition called?   |  |    |                       |                 |
| <b>Answer: b) Underflow</b>  |   |  |    |                       |                 |
|  | a)  | Overflow   | b) | Underflow             | c) Syntax Error |
|  | d)  | Garbage Value  |    |                       |                 |
| 3.   | Given a binary tree with the following elements: 50, 25, 75, 10, 30, 60, 90. Which traversal technique will produce the following sequence? 10, 30, 25, 60, 90, 75, 50. |  |    |                       |                 |
| <b>Answer: c) Post-order</b>   |   |  |    |                       |                 |
|  | a)  | Pre-order  | b) | In-order              | c) Post-order   |
|  | d)  | Level order  |    |                       |                 |
| 4.   | Which sorting algorithm has a time complexity of $O(n \log n)$ in the average and worst case?   |  |    |                       |                 |
| <b>Answer: c) Quick sort</b>   |   |  |    |                       |                 |
|  | a)  | Bubble sort  | b) | Insertion sort        | c) Quick sort   |
|  | d)  | Selection sort   |    |                       |                 |
| 5.   | Which of the following statements about a linked list is true?  |  |    |                       |                 |
| <b>Answer: d) It consists of nodes linked by pointers.</b>   |   |  |    |                       |                 |

|     |   |  |    |   |    |   |    |   |
|-----|---|--|----|---|----|---|----|---|
|     | a)  | It has a fixed size.                               | b) | Elements stored contiguously in memory                                  | c) | It allows for efficient random access   | d) | It consists of nodes linked by pointers |
| 6.  | Which type of linked list has its last node pointing to the first node?<br><b>Answer: b) Circular linked list.</b>  |  |    |   |    |   |    |   |
|     | a)  | Singly linked list                                 | b) | Doubly linked list.   | c) | Circular linked list.   | d) | Sparse linked list.                     |
| 7.  | Travelling salesman problem is an example of<br><b>Answer b: Greedy Algorithm</b>   |  |    |   |    |   |    |   |
|     | a)  | Dynamic Algorithm                                  | b) | Greedy Algorithm  | c) | Recursive Approach  | d) | Divide & Conquer                        |
| 8.  | Time complexity of Depth First Traversal of is<br><b>Answer : a) <math>\Theta( V + E )</math></b>   |  |    |   |    |   |    |   |
|     | a)  | $\Theta( V + E )$                                  | b) | $\Theta( V )$   | c) | $\Theta( E )$   | d) | $\Theta( V * E )$                       |
| 9.  | Visiting root node after visiting left and right sub-trees is called<br><b>Answer C: Post order Traversal</b>   |  |    |   |    |   |    |   |
|     | a)  | In-order Traversal                                 | b) | Pre-order Traversal   | c) | Post-order Traversal  | d) | Level order                             |
| 10. | How is the 2nd element in an array accessed based on pointer notation?<br><b>Answer: a) <math>a[2]</math> is equivalent to <math>*(a + 2)</math> in pointer notation.</b> |  |    |   |    |   |    |   |
|     | a)  | $*a + 2$   | b) | $*(a + 2)$  | c) | $\&(a + 2)$   | d) | $*(a + 2)$                              |
| 11  | Which of the following is NOT a primary function of an operating system?<br><b>Answer: d) Database management</b>   |  |    |   |    |   |    |   |
|     | a)  | Memory management                                  | b) | Device management   | c) | File management   | d) | Database management                     |
| 12  | The Banker's algorithm grants resource requests if:<br><b>Answer: d) All of the above.</b>  |  |    |   |    |   |    |   |
|     | a)  | The requested resources are immediately available. | b) | The requested resources do not exceed the maximum claim of the process. | c) | The requested resources do not exceed the total resources available in the system | d) | All of the above                        |
| 13  | The Banker's algorithm is applicable to which type of resource allocation problem?<br><b>Answer: b) Non-preemptive resource allocation.</b>                               |  |    |   |    |   |    |   |

|    |   |   |    |   |    |   |    |   |
|----|---|---|----|---|----|---|----|---|
|    | a)  | Preemptive resource allocation.                                 | b) | Non-preemptive resource allocation.                       | c) | Dynamic resource allocation.  | d) | Distributed resource allocation.                  |
| 14 | The Dining Philosophers problem can lead to a deadlock if:<br><b>Answer: c) All the philosophers try to pick up both chopsticks simultaneously.</b>   |   |    |   |    |   |    |   |
|    | a)  | All the philosophers pick up their left chopstick first.        | b) | All the philosophers pick up their right chopstick first. | c) | All the philosophers try to pick up both chopsticks simultaneously. | d) | All the philosophers are hungry at the same time. |
| 15 | In the Dining Philosophers problem, the maximum number of philosophers who can eat simultaneously without deadlock is:<br><b>Answer: d) N-1, where N is the total number of philosophers.</b>   |   |    |   |    |   |    |   |
|    | a)  | 1   | b) | 2   | c) | 3   | d) | N-1, where N is the total number of philosophers. |
| 16 | Which memory management technique allows for efficient utilization of memory by allocating memory in variable-sized blocks?<br><b>Answer: b) Segmentation</b>   |   |    |   |    |   |    |   |
|    | a)  | Paging  | b) | Segmentation  | c) | Swapping  | d) | Fragmentation                                     |
| 17 | A deadlock in an operating system occurs when:<br><b>Answer: a) A process is unable to access a required resource indefinitely.</b>   |   |    |   |    |   |    |   |
|    | a)  | A process is unable to access a required resource indefinitely. | b) | A process gets stuck in an infinite loop.                 | c) | A process exceeds its allocated memory limit.                       | d) | A process encounters an error during execution.   |
| 18 | Consider a system with four processes: P1, P2, P3, and P4. The arrival times and burst times for each process are given in the table below:<br>Process           Arrival Time   Burst Time<br>P1                   0                   4<br>P2                   2                   6<br>P3                   4                   8<br>P4                   6                   2<br>Assuming the scheduling algorithm is First-Come, First-Served (FCFS), what is the average waiting time for these processes?<br><b>Answer: c) 9.75</b><br><b>Explanation: The waiting time for each process can be calculated by summing up the burst times of all previous processes. The waiting times for P1, P2, P3, and P4 are 0, 2, 6, and 12, respectively. The average waiting time is <math>(0 + 2 + 6 + 12) / 4 = 9.75</math>.</b> |   |    |   |    |   |    |   |
|    | a)  | 6.5   | b) | 8.25  | c) | 9.75  | d) | 10.5  |

|----|---|---------|---------------------|------------------|
| 19 | <p>Consider a system with three resource types (A, B, and C) and four processes (P1, P2, P3, and P4). The maximum resource allocation needs for each process are as follows:</p> <p>Process            Max Allocation (A, B, C)</p> <p>P1        3, 1, 2</p> <p>P2        2, 2, 3</p> <p>P3        1, 3, 1</p> <p>P4        4, 2, 1</p> <p>The current resource allocation and the maximum available resources in the system are as follows:</p> <p>Process            Allocation (A, B, C)    Available (A, B, C)</p> <p>P1            1, 1, 0                            2, 1, 1</p> <p>P2            1, 0, 2</p> <p>P3            1, 2, 1</p> <p>P4            0, 1, 1</p> <p>Using the Banker's algorithm, is the system in a safe state?</p> <p><b>Answer: b) No</b></p> |         |                     |                  |
|    | a) Yes  | b) No   | c) Cannot Determine | d) None of these |
| 20 | <p>Consider a system with five processes: P1, P2, P3, P4, and P5. The burst times for each process are given in the table below:</p> <p>Process            Burst Time</p> <p>P1        8</p> <p>P2        4</p> <p>P3        9</p> <p>P4        5</p> <p>P5        2</p> <p>Assuming the scheduling algorithm is Round Robin with a time quantum of 3, what is the turnaround time for process P3?</p> <p><b>Answer: d) 13</b></p>  |         |                     |                  |
|    | a) 10   | b) 11   | c) 12               | d) 13            |
| 21 | <p>A processor has an instruction cache with a hit rate of 90% and an access time of 1 ns. If the cache miss penalty is 20 ns, what is the average memory access time?</p> <p><b>Answer: c) 2.2 ns</b></p> <p><b>Explanation: The average memory access time can be calculated using the formula: Average Access Time = Hit Rate * Access Time + Miss Rate * Miss Penalty. Since the hit rate is 90% (0.9) and the miss penalty is 20 ns, the average access time is <math>(0.9 * 1 \text{ ns}) + (0.1 * 20 \text{ ns}) = 0.9 \text{ ns} + 2 \text{ ns} = 2.2 \text{ ns}</math>.</b></p>  |         |                     |                  |
|    | a) 1.1 ns   | b) 2 ns | c) 2.2 ns           | d) 3 ns          |
| 22 | <p>A computer system uses a direct-mapped cache with a cache size of 8 KB and a block size of 32 bytes. How many bits are needed for the cache index?</p> <p><b>Answer: b) 7 bits</b></p> <p><b>Explanation: The cache index represents the number of bits required to index the cache blocks. Since the cache size is 8 KB (<math>2^{13}</math> bytes) and the block size is</b></p>   |         |                     |                  |

|    |  |                                  |                             |                                 |
|----|--|----------------------------------|-----------------------------|---------------------------------|
|    | <b>32 bytes (<math>2^5</math>), the number of cache blocks is <math>2^{13} / 2^5 = 2^8 = 256</math>.<br/> <b>Therefore, the cache index requires 8 bits. However, in a direct-mapped cache</b> </b>  |                                  |                             |                                 |
|    | a) 5 bits  | b) 7 bits                        | c) 9 bits                   | d) 11 bits                      |
| 23 | Which memory type is the closest to the CPU and provides fast access to frequently used data?<br><b>Answer: a) Cache memory</b>  |                                  |                             |                                 |
|    | a) Cache memory  | b) Main memory (RAM)             | c) Virtual memory           | d) Secondary memory (Hard Disk) |
| 24 | Which addressing mode uses a base register plus an offset to calculate the memory address?<br><b>Answer: d) Indexed addressing mode</b>  |                                  |                             |                                 |
|    | a) Immediate addressing mode   | b) Direct addressing mode        | c) Indirect addressing mode | d) Indexed addressing mode      |
| 25 | A computer system uses a 32-bit virtual address and a 4 KB page size. How many entries are there in the page table?<br><b>Answer: c) 1024 entries</b><br><b>Explanation: The number of entries in the page table can be calculated by dividing the virtual address space size by the page size. Since the virtual address is 32 bits (<math>2^{32}</math>) and the page size is 4 KB (<math>2^{12}</math>), the number of entries is <math>2^{32} / 2^{12} = 2^{20} = 1024</math> entries.</b> |                                  |                             |                                 |
|    | a) 256 entries   | b) 512 entries                   | c) 1024 entries             | d) 2048 entries                 |
| 26 | In a pipelined processor, which hazard occurs when the current instruction depends on the result of a previous instruction that has not yet completed?<br><b>Answer: a) Data hazard</b>  |                                  |                             |                                 |
|    | a) Data hazard   | b) Control hazard                | c) Structural hazard        | d) Pipeline hazard              |
| 27 | Which cache mapping technique provides the fastest access time but has limited capacity?<br><b>Answer: d) Fully associative mapping</b>  |                                  |                             |                                 |
|    | a) Direct mapping  | b) Associative mapping           | c) Set-associative mapping  | d) Fully associative mapping    |
| 28 | Which technique is used to reduce the effect of memory latency in a pipelined processor?<br><b>Answer: c) Out-of-order execution</b>   |                                  |                             |                                 |
|    | a) Branch prediction   | b) Instruction-level parallelism | c) Out-of-order execution   | d) Loop unrolling               |
| 29 | Which technique is used to minimize the impact of control hazards in a pipelined processor?<br><b>Answer: a) Branch prediction</b>   |                                  |                             |                                 |
|    | a) Branch prediction   | b) Data forwarding               | c) Loop unrolling           | d) Out-of-order execution       |
| 30 | Example of immediate addressing mode is:<br><b>Answer: c) SUB A, #10</b>   |                                  |                             |                                 |
|    | a) MOV A, B  | b) ADD A, [B]                    | c) SUB A, #10               | d) JMP LABEL                    |
| 31 | Which of the following is NOT a component of a formal language?<br><b>Answer: d) Compiler</b>  |                                  |                             |                                 |

|    |  |   |    |  |    |  |    |  |
|----|--|---|----|--|----|--|----|--|
|    | a)   | Alphabet  | b) | Syntax   | c) | Semantics  | d) | Compiler   |
| 32 | Which type of automaton recognizes regular languages?<br><b>Answer: b) Finite automaton (FA)</b>   |   |    |  |    |  |    |  |
|    | a)   | Pushdown automaton (PDA)                                      | b) | Finite automaton (FA)  | c) | Turing machine (TM)                                  | d) | Linear-bounded automaton (LBA)   |
| 33 | The Chomsky hierarchy classifies formal languages into how many levels?<br><b>Answer: C) 4</b>   |   |    |  |    |  |    |  |
|    | a)   | 2   | b) | 3  | c) | 4  | d) | 5  |
| 34 | Which type of automaton has both a finite control unit and an unbounded tape?<br><b>Answer: c) Turing machine (TM)</b>   |   |    |  |    |  |    |  |
|    | a)   | Finite automaton (FA)   | b) | Pushdown automaton (PDA)   | c) | Turing machine (TM)                                  | d) | Mealy machine  |
| 35 | The language accepted by a Turing machine with a halting state is known as:<br><b>Answer: d) Recursive enumerable language</b>   |   |    |  |    |  |    |  |
|    | a)   | Regular language  | b) | Context-free language  | c) | Context-sensitive language                           | d) | Recursive enumerable language  |
| 36 | Which of the following is a non-deterministic automaton?<br><b>Answer: b) Pushdown automaton (PDA)</b>   |   |    |  |    |  |    |  |
|    | a)   | Finite automaton (FA)   | b) | Pushdown automaton (PDA)   | c) | Turing machine (TM)                                  | d) | Mealy machine  |
| 37 | Which of the following is true about regular languages?<br><b>Answer: d) They can be recognized by a finite automaton.</b>   |   |    |  |    |  |    |  |
|    | a)   | They can be recognized by a Turing machine.                   | b) | They can be recognized by a pushdown automaton.                    | c) | They can be recognized by a linear-bounded automaton | d) | They can be recognized by a finite automaton.                                  |
| 38 | The Chomsky normal form (CNF) is a way to represent a context-free grammar (CFG) where:<br><b>Answer: d) All the production rules have at most two non-terminals on the right-hand side.</b> |   |    |  |    |  |    |  |
|    | a)   | All the production rules are in the form $A \rightarrow aB$ . | b) | The start symbol is on the left-hand side of the production rules. | c) | There are no $\epsilon$ -productions in the grammar  | d) | All the production rules have at most two non-terminals on the right-hand side |
| 39 | Which of the following is a regular expression for the language of all strings over $\{a, b\}$ that contain at least one "a"?  |   |    |  |    |  |    |  |

|    |   |  |    |   |    |  |    |  |
|----|---|--|----|---|----|--|----|--|
|    | <b>Answer: (a+b)a(a+b)</b>  |  |    |   |    |  |    |  |
|    | a)  | ab   | b) | (ab)*   | c) | (a+b)*   | d) | (a+b)a(a+b)                                      |
| 40 | Which type of automaton is used in lexical analysis for tokenizing source code?<br><b>Answer: a) Finite automaton (FA)</b>  |  |    |   |    |  |    |  |
|    | a)  | Finite automaton (FA)                          | b) | Pushdown automaton (PDA)                          | c) | Turing machine (TM)                                | d) | Linear-bounded automaton (LBA)                   |
| 41 | Typically, a database administrator (DBA) is responsible for:<br><b>Answer d) All of the above</b>  |  |    |   |    |  |    |  |
|    | a)  | Schema definition                              | b) | Schema modification                               | c) | Granting of authorization for data access          | d) | All of the above                                 |
| 42 | Which of the following queries will retrieve students whose name has 'p' as the second letter ?<br><b>Answer: c) SELECT rollNo FROM student where name LIKE ' _p%';</b>   |  |    |   |    |  |    |  |
|    | a)  | SELECT rollNo FROM student where name = ' _p'; | b) | SELECT rollNo FROM student where name LIKE ' _p'; | c) | SELECT rollNo FROM student where name LIKE ' _p%'; | d) | SELECT rollNo FROM student where name IN ' _p%'; |
| 43 | Consider a relation R(A, B, C, D, E) and a set of all FDs that hold on R as given below:<br>$\{A \rightarrow BC, CD \rightarrow E, B \rightarrow D, E \rightarrow A\}$<br>Choose the correct option:<br><b>Answer: c) R is in 3NF, not in BCN</b>                       |  |    |   |    |  |    |  |
|    | a)  | R is in 1NF, not in 2NF                        | b) | R is in 2NF, not in 3NF                           | c) | R is in 3NF, not in BCNF                           | d) | R is in BCNF                                     |
| 44 | Consider the following two sets of functional dependencies:<br>$F = \{A \rightarrow C, AC \rightarrow D, E \rightarrow AD, E \rightarrow H\}$<br>$G = \{A \rightarrow CD, E \rightarrow AH\}$<br>Choose the correct option:<br><b>Answer: c) F and G are equivalent</b> |  |    |   |    |  |    |  |
|    | a)  | only F covers G                                | b) | only G covers F                                   | c) | F and G are equivalent                             | d) | None of the above                                |
| 45 | Consider the following schedule S.<br>S: R1(X); W1(X); R2(X); W2(X); R1(Y); R2(Y);<br>Which of the following is a non-conflicting pair of operations in the schedule S?<br><b>Answer: a) R1(X); W1(X);</b>  |  |    |   |    |  |    |  |
|    | a)  | R1(X); W1(X);                                  | b) | W1(X); R2(X);                                     | c) | W1(X); W2(X);                                      | d) | R1(X); W2(X);                                    |
| 46 | To be conflict serializable, all transactions should follow _____<br><b>Answer: b) Two phase locking</b>  |  |    |   |    |  |    |  |
